

About the “California registered products” list

The “California registered products” list consists of product names and California registration numbers of products currently registered by the Department of Pesticide Regulation. It does not include products whose registrations have expired but that may be in the channels of trade and legal to sell in California.

The field format is fixed. There are five fields.

The first four fields consist of a total of 22 numerical characters: They represent the California registration number.

- Digits 1-7. Firm number. It may be as long as seven digits, or as short as 1. Zeros are placeholders for shorter numbers.
- Digits 8-12. Product or label number. It may be five digits or fewer.
- Digits 13-14. “California revision code.” California requires companies to register individual brand names, and this letter code creates a unique identifier for each product.
- Digits 15-21. Distributor or sub-registrant number, identifying a company that is marketing a product owned by another company. If this field and the first field are the same, then the product is NOT a distributor registration.

The fifth field is the product name, digits 22 through 101.
